### Summary Points

- In the short-term, the global economy will recover back to decent levels. Governments and central banks are unlikely to withdraw their stimulus measures after they have gone “all in”.
- In the medium-term, the combined support from governments and central banks will give rise to zombie companies and weigh on productivity and GDP growth. Japanification is a long-term risk.
- The US economy is recovering better than anticipated and visibility has improved. That said, the good news seems to be already largely priced into equities.
- Europe has suspended its state aid and fiscal rules to support the economic bloc. With the “Next Generation EU” recovery fund, the Euro-zone is about to move one step closer to a fiscal union.
- China has suspended economic growth targets and its support measures are more focused on the government controlled production side. The Chinese recovery will be positive for industrial metals.
- Conclusion: In fixed income, European government bonds have lost their “safe-haven” status. Buy US Treasuries for diversification reasons and as a hedge. Default rates will rise but policy support of all kinds will put a cap on them. Short dated non-cyclical high yield bonds, European senior loans and Asian bonds in general are our asset classes of choice. In equities, momentum has become more important than fundamentals and the economic rebound is already largely priced in. Expect equity markets to trade range bound or entering a bubble.

## 1 Regional macro-economic backdrop

### Markets climbing a wall of money

The Covid-19 pandemic has led to drastic actions around the world. **Never before in history** has it been so easy for Western governments to **increase fiscal expenditures through debt**. All of this supported by central banks providing **unprecedented stimulus measures** and vocal guarantees to keep the whole yield curve depressed. **Central banks' influence has reached extreme levels** and their interference of all kinds is leading to zombie companies (only surviving thanks to low rates/government support), inefficient markets and less growth further down the road. **In the short-term, the world economy will recover** (to levels we do not know yet), **financial repression** (negative real rates) will continue and the **wall of money**, waiting on the side lines, will sooner or later find its way back into financial markets (chart 1). Equity markets may not be cheap on an absolute basis but are still attractive relative to government and investment grade bonds which have a negative real rate. In such an environment, alternative investments may become more popular again.

### United States

Despite all uncertainties, market **visibility has improved** and market consensus expects **US GDP growth to drop by -5.7%** in 2020 and to recover to 4.1% in 2021. Although, a second wave of Covid-19 infections is widely expected, **there will not be another lockdown** with the same economic pain. First, authorities have ramped up the healthcare systems and, second, measures are in place to protect the vulnerable. In addition, news are making headlines that AstraZeneca could bring an effective vaccine onto the market by the end of this year. Although the pandemic hits small businesses harder than large ones, the **demand slowdown is not compounded by a credit crunch**. This is thanks to the USD 510-billion Paycheck Protection Program, which helped to prevent a solvency problem. As a result, the **US economy is recovering better than anticipated** and cyclical sectors are gathering strength. In June, the Chicago Fed National Activity index jumped from -17.9 to 2.6 (chart 2), the Conference Board Leading index rose from -6.1 to 2.8 and the NAHB Housing Index rose from 37 to 58. This **good news is already largely priced into the equity market**. At current levels, equities may even have entered a speculative phase, hence, further upside largely depends on continuing fiscal support, which can be expected during an election year.

The **US Fed**, with its dual mandate of maximum employment and price stability, indicated that it will **keep interest rates at ultra-low levels** until at least the end of

2022 and it will remain committed to its various asset purchase programmes. Besides its already expansionary monetary policy, the **US Fed surprised markets** with a USD 250-billion programme to **buy individual corporate bonds**. This is an additional interference into the US bond market and sets a floor for individual corporate bond prices. The Fed's interest rate policy **interrupts the USD strengthening path** as rates have fallen from 1.75% to 0.25% since March 2020.

## Europe

European politics only react to pressure. With the Covid-19 pandemic, Europe suspended its state aid and fiscal rules and **Germany eventually over threw its reluctance to spending** and put together a fiscal stimulus programme worth 9% of GDP. In parallel, the European Central Bank (ECB) announced that it would increase its bond purchase programs to EUR 1.35-trillion and extend it to the end of 2021. Despite the still mixed headlines, it seems that **Europe is closing the gap in industrial activity versus the US**. In May, for instance, the Eurozone Manufacturing PMI rose from 33.4 to 39.4, while the US PMI increased from 36.1 to 39.8. As **Europe should also benefit more from a cyclical upturn** in China, the old continent has the potential to surprise on the upside. For now, market consensus still expects **Eurozone GDP growth to drop by a hefty -8.1%** in 2020 and to recover to 5.5% in 2021. In June, Chancellor Merkel, President Macron and Ursula Von der Leyen (President of the European Commission) surprised markets as they pushed forward a programme of fiscal risk sharing. The plan includes a EUR 750-billion **recovery fund named “Next Generation EU”**, which would be the **first step towards a fiscal union**. Structurally a fiscal pact would be a complete game changer not just for one to two years but for the next ten years. Negotiations have just started and first results are expected in July this year.

### Bond investors are faced with a new dilemma.

During times of uncertainties they typically flocked to government bonds, such as German 10-year Bunds (currently yielding -0.4%).

That said, **German Bonds can no longer** be perceived as **safe haven assets**. To give an example: German Bund prices rallied +10% during the global credit crisis in 2008 and +18% during the Euro debt crisis in 2011. In 2020, however, they were flat during the peak of the Covid-19 pandemic (chart 3). In other words, German Bund prices are close to the lower limit of yields and cannot rise much but could fall a lot. The same accounts for many other European government debt papers.

## China and emerging markets

At the **National People’s Congress in May** this year, China opted **not to set an economic growth target**. Instead it outlaid its plans to boost fiscal expenditure to 11% of GDP in 2020 (6.5% in 2019) and focused on its new “six protections policy” programme. As **social discontent remains a key concern** to the Chinese government, the three key components of its new programme are job security, people’s livelihoods and businesses. Since the virus-induced lockdown, the Chinese **domestic economy has recovered quite well**, particularly on the more government controlled production side. Since February 2020, the China manufacturing index has recovered from 35.7 back to 50.6. A **key measure on the business side is the producer price inflation index (PPI)**, which fell to -3.7% yoy indicating price deflation. Hence, Beijing will continue stimulus measures, keep interest rates low (3-month SHIBOR 2.1%) and new loan growth high (ytd USD 1.46-trillion or +23% yoy) until the PPI starts to recover again (chart 4). Market expectations for **China’s GDP growth in 2020** are to drop to **1.8%** and to recover to 8% in 2021.

The aforementioned policies should have a positive impact on the global industrial cycle and lead to **higher prices for commodities**, especially industrial metals.

Hence, other emerging markets and suppliers of raw materials should benefit from Beijing’s policies. In addition, a weaker US Dollar will help ease global financial conditions, in particular for emerging markets with high hard currency debt.

## Investment conclusions

The world economy is completely in unprecedented territory and **central banks' influence has reached extreme levels**. Capitalism was a self-cleaning system, where imbalances were periodically reset. The low cost of money prevents the system from self-cleaning. It is not that the central banks' policy is misguided as they had no other choice in order to prevent an economic collapse. The current situation, however, requires investors to differentiate between short-term and medium-term consequences. **In the short-term**, the massive stimulus packages have their effect on the global economy and **end demand will recover** back to decent levels. Over at least the next 12-months it is unlikely that governments and central banks will suddenly withdraw their stimulus after they **have gone "all in"** over the last 3-months. The short-term picture is deflationary, as energy prices are depressed and unemployment is high.

**Fixed income:** Western central bank policies will keep government and investment grade bond **yields at historically low levels** and unattractive. Unlike European government bonds, US treasuries can still be used as a diversifier and a hedge during market drawdowns. Market expectations are that **default rates rise to between**

**8-12%** or less for credits eligible for emergency lending facilities. Taking the authorities' support measures into account we prefer **non-cyclical short dated high yield bonds, Asian bonds and European loans**.

**Equities:** With so much cash on the side-lines, fundamental analysis will be less important and **momentum becomes king**. The price-earnings ratio for world equities is currently at 21 and world equities are probably more than fairly valued. There is a tug of war between the pace of economic improvement and the fears of a second wave of infections. Over the next three months, investors should **expect range bound equity markets**, unless the stock market is entering a bubble. As global growth recovers and the US Dollar tends to weaken, **European and emerging market stocks** should be at an advantage and **cyclical sectors should outperform defensives**.

In the **medium-term**, governments' fiscal largesse and central banks' expansionary policies will give **rise to zombie companies** and **weigh on productivity** and eventually GDP growth. If the effect is strong enough, it could even depress interest rates further and **move us closer to Japanification**.

## 5 Scenario Overview 6 months

Base Case 70%	Investment conclusions
<ul style="list-style-type: none"><li>▪ <b>US:</b> U-shaped recovery; Q4 GDP level ~94% yoy. US is in the midst of a severe recession of an unseen magnitude. Unprecedented government and central bank support softens the damage somewhat. H2 will benefit from pent-up demand, but on-going local lockdowns and social distancing measures prevent a full recovery by year end. Steep increase of corporate defaults (mainly energy/services sectors).</li><li>▪ <b>Eurozone</b> GDP growth collapses (Q4 GDP level ~92% yoy) with immense damage to Southern Europe as the tourism season is disastrous. Huge fiscal stimulus (and solidarity payments from north to south) and unprecedented actions of the ECB can avoid a financial collapse for now, but Europe acts as the weakest link to the Covid-19 crisis.</li><li>▪ <b>Chinese</b> GDP growth negative in H1; recouping all in H2 for a minimal positive number in 2020.</li><li>▪ <b>Oil:</b> Prices stabilize but remain volatile.</li></ul>	<ul style="list-style-type: none"><li>▪ <b>Equities:</b> Have recovered quickly and trade on 2021 earnings expectations. Equities are vulnerable with P/E 2021 multiples &gt;18. If second wave infections lead to prolonged and wider regional lockdowns, volatility will come back. Ultra-loose central banks provide equities an advantage vs. low (negative) interest bearing bonds. Asian &amp; selective EM equities are preferred.</li><li>▪ <b>Interest rates:</b> Slightly negative on rates as limited scope for lower (EUR) yields. (US) Duration exposure still serves as a valid diversifier and tail hedge, but less effective at these levels.</li><li>▪ <b>Credit:</b> Credit spreads have room to tighten despite spiking corporate defaults. (European) Loan recovery has further to run. IG bonds benefit from Fed/ECB buying programs. Overweight in Asian bonds (lower defaults, higher yields).</li><li>▪ <b>Commodities/FX:</b> USD stops strengthening heading into H2. Gold benefits.</li></ul>
Bull Case 15%	Investment conclusions
<ul style="list-style-type: none"><li>▪ <b>US:</b> V-shaped recovery with GDP resumption rate &gt;95%. Limited further regional lockdowns and Sweden acts as the role model for social distancing measures. Add-on fiscal stimulus program timely implemented. Recovery feeds into all parts of the economy, even service sectors recover 70-80%.</li><li>▪ <b>Europe:</b> Thanks to the V-shape recovery and the immense fiscal (incl. recovery fund) and monetary stimulus, peripheral countries avoid a collapse.</li><li>▪ <b>China/EM:</b> Normalization in Q2. H2 will be particularly strong as export markets recover (EU/USA) and interest rates remain low and help ease the pressure on local FX depreciation.</li></ul>	<ul style="list-style-type: none"><li>▪ <b>Equities:</b> Equities fall but should not make new lows. Highly priced US equities will lead the correction, followed by Europe.</li><li>▪ <b>Interest rates:</b> Rates will go lower, but not much room left. Support for high quality assets (US Treasuries, A and AA corporate bonds or agency bonds). Cash is king!</li><li>▪ <b>Credit:</b> Financial crisis 2.0 is emerging. Corporate default rates climb above 12% p.a., but thanks to unprecedented monetary and fiscal spending a collapse of the financial system is avoided. Favour short dated/high quality bonds.</li><li>▪ <b>Commodities/FX:</b> Negative for commodity bloc, USD &amp; CHF (safe haven) remain robust.</li></ul>

Bare Case 15%	Investment conclusions
<ul style="list-style-type: none"><li>▪ <b>US:</b> W- or L-shaped recovery with GDP resumption rate &lt;94%. More and longer local/regional lockdowns as discipline in social distancing measures eases. Recessionary environment persists as knock-on effects cannot be avoided and furlough translates into effective unemployment.</li><li>▪ <b>Europe:</b> Peripheral countries are close to a collapse as the international tourism fallout is severe. Investors lose faith and Italian long-term yields rise. Germany is also unable to leave the recessionary territory. (EU confidence crisis 2.0).</li><li>▪ <b>China/EM:</b> Domestic China recovers, but exports suffer. Rest of EM is doing poorly as global trade is on low levels and currencies are depreciating</li></ul>	<ul style="list-style-type: none"><li>▪ <b>Equities:</b> Equities fall, but should not make new lows. Highly priced US equities will lead the correction, followed by Europe.</li><li>▪ <b>Interest rates:</b> Rates will go lower, but not much room left. Support for high quality assets (US Treasuries, A and AA corporate bonds or agency bonds). Cash is king!</li><li>▪ <b>Credit:</b> Financial crisis 2.0 is emerging. Corporate default rates climb above 12% p.a., but thanks to unprecedented monetary and fiscal spending a collapse of the financial system is avoided. Favour short dated/high quality bonds.</li><li>▪ <b>Commodities/FX:</b> Negative for commodity bloc, USD &amp; CHF (safe haven) remain robust.</li></ul>
Tail risks	
<ul style="list-style-type: none"><li>▪ Asset price bubble bursting, liquidity shock.</li><li>▪ An Italian sovereign debt crisis, Euro break up.</li><li>▪ US/China military conflict in the South China Sea.</li></ul>	<ul style="list-style-type: none"><li>▪ Iran closing the Strait of Hormuz, leading to an extended oil price shock.</li><li>▪ Emerging market meltdown similar to 1998.</li></ul>
